

I help organisations move through change when action is needed before the implications are fully understood. That means getting beneath the presenting problem, finding the gaps and tensions that matter, bringing together the right perspectives, and turning that understanding into a practical next move while keeping the longer horizon in view. Doing that well also requires intellectual humility, a willingness to question my own framing, to stay curious about what I may be missing, and to resist resolving uncertainty too quickly .

My first university degree was in urban and regional planning, building on earlier interests in permaculture design and horticulture and a curiosity about the systems that shape places and communities. I began my government career in Queensland in strategic policy roles, and have since worked across transport, regulation, emerging technology, strategy and program delivery in the APS. Over time, that work drew me further into futures, systems thinking and the governance of technological change. I recently completed a Master of Technology Governance at the Australian National University, which has helped me bring greater rigour to questions about how institutions understand, govern and adapt to change.

At Finance, I lead APS-wide AI enablement work that helps agencies make practical progress with the technology while learning from what its arrival is changing about work and institutions. The immediate challenge is adoption, helping agencies create the conditions to use AI safely and effectively. The deeper challenge is adaptation, understanding which structures and assumptions still serve a purpose, what is coming under pressure, and what may need to change. My work moves between those horizons, connecting what people and agencies are experiencing now with the broader shifts underway.

Over the last few years, I have turned increasingly to futures, systems, complexity and design practices to make sense of questions I was already wrestling with. The 2035 Telecommunications Strategy let me apply futures methods explicitly, but the deeper question has remained: why do capable people and institutions still struggle to coordinate, learn and adapt? The questions I explored in my 2024 piece, [The Bureaucratic Brain on GenAI](#), have continued to reshape how I think about organisational life and the mindsets needed for deep institutional and technological change.

It has also pushed me to build practice beyond my formal roles through [AI CoLab](#), the [Creative Bureaucracy Festival Australia and New Zealand](#), and the annual APS Innovation Month. These have given me different ways to convene practitioners, connect ideas across organisational boundaries, surface emerging practice and create spaces for shared learning. I am most energised by this relational work of change, facilitating difficult conversations, presenting, advocating, and helping groups make sense of what is happening together. I read widely, but I am most interested in what happens when thinking meets practice.

Outside work, I spend a lot of time walking and hiking, taking photos, and moving between natural landscapes and cityscapes. I am drawn to art, place and making things, and lately I have been reading more about embodiment, care, attention and what helps people stay grounded. I am interested in how we stay creative, connected and present.

That combination of inquiry, collaboration and practical change is what draws me to ThinkerTank. I would welcome the chance to explore how these interests and ways of working might connect with what you are building.
